

Cold Email Generator

Tech Stack :

- **LLM:** LLaMA 3.1 (hosted on Gro for faster inference)
- **Frameworks:** LangChain for orchestration
- **Database:** Chroma DB for storing vectorized skill–portfolio mappings
- **Frontend:** Streamlit for the user interface

This project is an AI-powered cold email generator designed to help software service companies craft personalized outreach emails based on job postings from potential clients. It uses LLaMA (11ama3-70b-8192) (hosted via Groq) to analyze job descriptions, extract required skills, and generate tailored cold emails. The system retrieves relevant portfolio links from a ChromaDB vector database, based on the extracted skills, and integrates them into the email. LangChain handles the web scraping and orchestration, while Streamlit provides an interactive frontend for input and output.

Workflow:

Input: User provides a URL to a job post (e.g., from Nike's career page).

Scraping: Use LangChain to extract text from the page.

Extraction: LLaMA (11ama3-70b-8192) parses the page content to generate structured JSON.

Vector Search: Query Chroma DB with skills to find relevant past project portfolio links.

LLM Prompt: Feed job post JSON + portfolio links to LLaMA 3.1 to generate a custom cold email.

Output: Display the email in Streamlit with an option to copy/download it.
